During a ZYTO scan, the Hand Cradle measures your body’s galvanic skin response (GSR). The data gathered by the Hand Cradle is evaluated by the software in the context of various digital signatures called Virtual Items. Virtual Items are representative of a wide range of things like foods, nutritional supplements, body organs, and systems.

Virtual Items can be organized in sequences for scanning. You can think of ZYTO scans as questionnaires to which your body’s GSR data provides the answers.

The numeric value produced by the ZYTO software indicates how divergent the digital signature response was from the baseline. We call digital signatures that produce more coherent or balanced responses biological preferences.

The digital signatures in ZYTO’s library each represent an actual item. After the software introduces each digital signature, a new corresponding GSR reading is taken. The GSR reading may have changed after the digital signature has been run in the ZYTO software.

At the completion of a scan, the software’s analysis is documented in the form of a report. Information gathered in this way can help you make decisions to maintain health and wellness. We call this whole process Biocommunication.

Knowing your body’s biological coherence can help you make better decisions about the wellness products you buy.
